Hiring & Research Selection Committee

Bose Corporation
Framingham, MA 01701

Dear Members of the Selection Committee,

I am writing to express my strong enthusiasm for joining the research and engineering team at Bose. As a researcher working at the intersection of geometric field theory, computational acoustics, and spatial hardware—and a lifelong musician and sound engineer—I have long admired Bose’s dedication to mastering acoustic science. I am submitting my research manuscript, *Acoustic-Levitated Dynamic Voxel System for Volumetric Field Visualization*, as a direct demonstration of how my theoretical framework and deep intuitive relationship with sound map into physical, production-ready technology.

My work introduces a dynamic volumetric display that utilizes ultrasonic phased-array levitation to manipulate illuminated particles into free-space voxels. What makes this system exceptional is its elegance and viability: it relies entirely on established, proven acoustic physics, operates on a simple and remarkably low-cost hardware footprint (\$200–\$400 total BOM), and is powered by my Single Entity Field Interpretation (SEFI) coordinate engine. Combined with my complete Python codebases and field simulations, this is not a speculative concept—it is a fully realizable, research-ready program ready for immediate physical deployment and testing.

Bose is the ideal fit for my background because your legacy is built on bridging technical audio mastery with profound acoustic experience. My platform bridges spatial audio, physical mid-air acoustic interfaces, and real-time field visualization into a tangible product domain. Furthermore, Bose’s proximity to premier research institutions aligns perfectly with my commitment to completing a PhD in Physics via publication and direct research output.

I am fully prepared to relocate immediately to wherever my work and research can best be put to the test, and I am eager to make Bose my long-term professional home.

Thank you deeply for taking the time to review my application, manuscript, and codebases. I welcome the opportunity to discuss how my lifelong dedication to sound and research can directly contribute to Bose’s next generation of acoustic innovations.

Sincerely,

Jason Dutton
